16. ABSTRACT

This report presents the 2'nd edition of the Air Toxic Pollutant/Source Crosswalk that associates emitting source categories with specific air toxics compounds. This is a qualitative association and does not provide any information about the quantities of pollutants emitted. The crosswalk contains pollutant names, Chemical Abstract Service (CAS) numbers, Standard Industrial Classification (SIC) codes, and Source Classification Codes (SCC's). This report contains 15,000 associations for more than 1100 air toxic compounds. This second edition revises and expands the report, Toxic Air Pollutant/Source Crosswalk - A Screening Tool For Locating Possible Sources Emitting Toxic Air Pollutants, EPA-450/4-87-023a. A software system, XATEF, containing the crosswalk has been developed for easy access and updating of the data. Use of the system is explained in the EPA report, Crosswalk Air Toxic Emission Factor Data Base Management System User's Manual. EPA is making available the system and data base records to agency users upon request.

The purpose of this report is to offer a technical service to air pollution control agencies in performing preliminary assessments of the types and sources of toxic compounds in an area. The crosswalk helps agencies to identify the potential of pollutants to be emitted from sources in an area.

SECTION 1. INTRODUCTION

The U.S. Environmental Protection Agency (EPA) and State and local air pollution control agencies are in the process of developing programs to control air toxics. The development of an air toxics program requires information about the types, sources, and emissions of pollutants in a geographic area. One of the major components of an air toxics program is an assessment of the types and quantities of toxic compounds present through an emissions inventory. Prior to initiating a detailed air toxics inventory, it often proves helpful as part of the planning process to conduct a screening study. The primary purposes of a screening study are to identify pollutants and sources and to develop preliminary emissions estimates in order for an agency to focus its program and resources on the most important sources and pollutants. One useful screening tool is a table that associates emitting source categories with specific pollutants. These cross indexes, or pollutant/source "crosswalk" tables, indicate the potential for a given substance to be emitted by a particular type of facility. Crosswalk tables only provide qualitative identification and do not provide any information about the quantities of pollutants emitted from the source categories. The crosswalk tables can help an agency decide which toxic pollutants merit further analyses and expenditure of resources. The crosswalk tables have also been used to enforce regulations such as SARA 313 and State and local air toxics inventory requirements.

In order to offer assistance to agencies compiling air toxics emission inventories, EPA in July 1986 published a report entitled Compiling Air Toxics Emission Inventories (now being revised).[1] Appendices C - G of that report presented information that enabled agencies to implement screening procedures through the use of pollutant/source crosswalk tables. In December 1987, EPA published a report entitled Toxic Air Pollutant/Source Crosswalk - A Screening Tool For Locating Possible Sources Emitting Toxic Air Pollutants (Referred to as Crosswalk).[2] The Crosswalk updated and greatly expanded the information presented in Appendices C-G of the 1986 report. The data in Crosswalk were obtained primarily from permitting and source test information contained in the 1986 National Air Toxics Information Clearinghouse (NATICH) data base.[3,4] Additional data were gathered from the Organic Chemical Producers' Data Base and Air Emissions Species Data Manual. Volume I. Volatile Organic Compound Species Profiles.[5] A software system (XWALK) was also developed that contained the data in the Crosswalk tables.

Since the publication of the original Crosswalk, EPA has compiled additional pollutant/source category information into this Second Edition which expands and updates the data in the first edition. The XWALK data system has been revised and combined with

the Air Toxics Emission Factor (ATEF) data base to form the "XATEF" data system.

Section 2 describes the contents of Sections 3 - 5 of this report and explains the uses and shortcomings of the information. The user should be aware that the data presented herein are by no means complete. Sections 3 - 5 contain the pollutant/source associations. Section 3, "SIC Code/SCC/Pollutant Cross Index", presents the Crosswalk data sorted by Standard Industrial Classification (SIC) code. Section 4, "Pollutant/SIC Code Cross Index", presents associations of pollutants and SIC codes sorted by pollutant. Section 5, "Pollutant/SCC Cross Index", presents associations of pollutants and Source Classification Codes (SCC's) sorted by pollutant.

The XATEF system containing both air toxics pollutant/source crosswalk data and air toxics emission factor data has been developed to allow for easy access to the data. The software is an IBM™ PC-based application that combines the crosswalk data (formerly XWALK) and air toxic emission factor data (formerly ATEF) into one database. The XATEF presents crosswalk data consisting of pollutant names, Chemical Abstracts Service (CAS) numbers, SIC codes, SIC code descriptions, SCC's, SCC descriptions, and references for the associations. The XATEF also presents emission factors associated to pollutant names, CAS numbers, industrial process descriptions, SIC codes, specific emission source descriptions, SCC's, references, and notes about process control and development of factors. The data management system allows one to search and print data. The system has been designed specifically for easy data manipulation, even by fairly inexperienced users. No specific programming knowledge is required to search or print the data. Use of the XATEF system is explained in a user's manual entitled Crosswalk/Air Toxic Emission Factor Data Base Management User's Manual. The user's manual and data system are available to State and Local agencies from EPA upon request. Users will need an IBM PC compatible system with 512 kilobytes of random access memory and a hard disk with at least 10 megabytes of free storage. Requests for the system and the user's manual can be made by contacting the Noncriteria Pollutant Programs Branch, U.S. EPA, OAQPS, MD-15, Research Triangle Park, North Carolina 27711, or by calling (919) 541-5373 or (FTS) 629-5373.

This second edition of the crosswalk will be updated and expanded as new emissions data are obtained. Comments on the usefulness of this document and the XATEF data base system are welcomed as is any emissions information that would allow EPA to update and expand the pollutant/source association tables.

SECTION 2. USE OF CROSSWALK

The crosswalk data compiled in this second edition are presented in Sections 3, 4, and 5 . These data include:

- chemical name and Chemical Abstracts Service (CAS) number,
- Standard Industrial Classification (SIC) code and SIC code description,
- Source Classification Code (SCC) and SCC description, and
- references.

Section 3 presents all of the above data sorted by SIC code. Section 4 presents pollutant and SIC code associations sorted by pollutant. Section 5 presents pollutant and SCC associations sorted by pollutant. CAS numbers, SIC codes and SCC's are used in the crosswalk to provide a means of identifying (in standard terminology) pollutants, industrial processes and specific emission processes/sources. For some substances, CAS numbers are not available for groups or mixtures of chemicals such as polycyclic organic matter (POM). When CAS numbers are unavailable, the CAS number is blank in the tables. For some sources, the SIC codes and SCC's are truncated in the tables based on available data. SIC codes may be presented as two, three, or four digit numbers based on available information. SCC's may also be truncated to less than the full eight digits.

Appendix A presents a list of the pollutants contained in Sections 3, 4, and 5. Table A-1 lists alphabetically the air toxics and their respective CAS numbers and chemical synonyms, if available, contained in this report. Because available information on air toxics emissions is limited, the pollutant/source associations are only provided for selected air toxic compounds and sources and not for all identified air toxics and sources. The list of pollutants in Table A-1 represents air toxics for which emissions data are available. Table A-2 lists the air toxics contained in this report by CAS number.

The second edition contains more than 1100 compounds for which pollutant/source data were available for both point and area sources. Approximately 900 pollutants have been added to original data base of 241 compounds to enhance the usefulness of crosswalk. The list of compounds in the second edition includes most common air toxic substances presently under investigation or regulated by State and local control agencies and Federal NESHAP regulations. The list contains more pollutants than most agencies will need to consider, while there may be other pollutants and source categories of interest in some areas that are not listed here. Many air toxics may not be emitted in every locale while some air toxics will be fairly widespread in most urban areas such as benzene, formaldehyde and trichloroethylene. Many other air toxics that are primarily associated with point sources such as acrylonitrile,

Preceding page blank

epichlorohydrin and phosgene may only be emitted by a few large producers or users in the entire United States and may not be emitted at significant levels in most areas. Because each area has a unique inventory of toxic air pollutants, no single list will likely contain all of the appropriate pollutants or source categories that may be present in a specific locale. The list of compounds in the second edition is not exhaustive for all possible air toxics, and agencies are advised not to feel restricted only to this list in selecting pollutants.

The list of 241 air toxics considered in the first edition was the starting point for updating the list of air toxics in the second edition. Sections 3, 4, and 5 of this second edition are based on the following sources of data:

- 1987 and 1988 NATICH permitting files and source test data,[1,2]
- 1987 SARA 313 Toxic Release Inventory (TRI) data base,[3]
- Organic Chemical Producer's Data Base,[4]
- First Edition of Crosswalk,[5]
- Species Data Manuals, Volumes I and II, VOC and PM,[6,7]
- Air Toxic Emission Factor (ATEF) data base,[8]
- Other EPA reports, and
- State and local data.

The first edition of crosswalk was revised and references were added for each of the associations. The SIC codes in the first edition were revised to conform to the 1987 SIC Code Manual.[9] Additional SIC codes and SCC's associations with pollutants were added primarily from the NATICH reports, Species Data Manuals, and ATEF data base. Additional SIC code/pollutant associations from the 1987 SARA 313 Toxic Release Inventory data base and the Organic Chemical Producer's data base were added to the crosswalk. State and local data as well as other reports including EPA reports and journal articles provided additional crosswalk data.

The main pollutant/source category indexes presented in Sections 3, 4, and 5 show the potential toxic air pollutants that may be emitted by sources in certain industrial and process categories. The SIC codes presented in the crosswalk tables are broad descriptors of industry segments that are used throughout the Government to define industries in accordance with the composition and structure of the economy. For this reason, the SIC codes may not represent specific emitting sources. The SIC codes used in this edition are the revised codes presented in the 1987 SIC code manual.[9] Appendix B contains a listing of SIC codes and descriptions. The SCC's in the crosswalk represent processes or functions within a source category associated with a point of air pollutant emissions. Appendix C presents a listing of SCC's and descriptions. While SCC's are more specific to pollutant emissions than are SIC codes, both types of codes can be associated with specific potential pollutants. Each SIC category has a

relatively limited number of specific SCC's within it, and each SCC source in turn can generally be associated with a fairly specific set of air toxics. Because most industrial processes involve various "recipes" (varying ore compositions, feedstocks, proprietary additives, and process parameters), the specific mix of pollutants emitted from a particular category cannot be defined to cover all sources precisely. Thus there are likely to be other potential toxic air pollutants associated with these codes in addition to those shown in these tables, and there are likely some sources in a category that do not emit all of the pollutants associated with these codes.

The data quality of the pollutant/source associations varies considerably. Some associations are based on several observations of processes while others are based on a very limited number of observations of processes. For example, the SARA 313 Toxic Release Inventory data base contains 60 reports of air releases of styrene from sources having SIC code 2851 (Paints and allied coatings) and 1 report of air releases of styrene from sources with SIC code 3083 (Laminated plastics plate and sheet).

Source tests and permit files in NATICH are the basis of many of the associations in the crosswalk. NATICH air toxics data are voluntarily submitted annually by state and local agencies. Other associations are based on engineering judgement such as some of the data obtained from the Species Manuals or from the ATEF data base. The Species Manuals and the ATEF data base as well as other EPA reports also provide associations based on source testing and national emission estimates of pollutants. Emissions from sources as reported by the plants themselves are contained in the SARA 313 TRI reports used in the second edition. SARA 313 requires facilities to annually report emissions of listed chemicals to air, water, and land on TRI forms that are submitted to the States and to the Office of Toxic Substances in EPA.

The crosswalk tables in this report are intended to be used for identifying the potential of pollutants to be emitted from sources in an area. Because these tables are based on data of wide range and varying degrees of accuracy, the list of actual pollutants emitted from a given facility may be different from the pollutants associated with a source in this document. For the most accurate identification of pollutants emitted from a particular facility in a given area, source specific data should be obtained whenever possible. When source specific data are not available, the crosswalk can be used to identify potential pollutants associated with sources in a given area or potential sources associated with pollutants of concern in a given area. More information concerning the pollutant/source associations presented in Sections 3, 4, and 5 may be obtained from the primary references listed with each association.

APPENDIX A

COMPOUNDS IN SECOND EDITION OF TOXIC AIR POLLUTANT/SOURCE CROSSWALK

TABLE A-2. CAS LIST OF AIR TOXICS IN SECOND EDITION OF CROSSWALK

CAS NUMBER	COMPOUND NAME	CHEMICAL SYNONYM
50-00-0	FORMALDEHYDE	
50-22-6	CORTICOSTERONE	COMPOUND BETA
50-29-3	ETHANE, 1,1,1-TRICHLORO-2,2-BIS(P-CHLOROPHENYL)	DDT
50-32-8	BENZO(A)PYRENE	1,2-BENZOPYRENE BENZ(A)PYRENE
50-78-2	SALICYLIC ACID ACETATE	ACETYLSALICYLIC ACID
51-28-5	PHENOL, 2,4-DINITRO-	2,4-DINITROPHENOL
51-75-2	DIETHYLAMINE, 2,2'-DICHLORO-N-METHYL-	NITROGEN MUSTARD
51-79-6	URETHANE	ETHYL CARBAMATE CARBAMIC ACID, ETHYL ESTER
52-68-6	PHOSPHONIC ACID,(2,2,2-TRICHLORO-1-HYDROXYETHYL)-,DIMETHYL	TRICHLORFON
53-70-3	ANTHRACENE, DIBENZ(A,H)-	DIBENZ(A,H)ANTHRACENE
53-96-3	ACETAMIDE, N-9H-FLUOREN-2-YL	ACETAMIDE, N-FLUOREN-2-YL- FLUORENYLACETAMIDE,N-,2-
55-21-0	BENZAMIDE
